

The expense of constructing a new pond warrants the need for continued maintenance and upkeep of your investment, while avoiding the cost and potential hazards of excessive chemical use or dredging. One of the easiest and most economical ways of achieving this is to use a fountain or a display aerator . A lack of oxygen in a body of water will provoke fish kills, foul odors, algae growth, and will induce the establishment of stagnant vegetation . Oxygen can be added to your pond by using a Scott Aerator. Simply put, a Scott Aerator integrates dissolved oxygen into your water, facilitating the natural breakdown of decaying vegetation while also vastly improving the quality of your water for fish, irrigation, and many other purposes. The Scott Aerator works exceptionally well in low circulation areas to avoid the undesirable affects of algae build-up. The Scott Aerator is the only product of its kind that contains no oil, is rustproof, and is totally pollution free. The Scott Aerator eliminates the problem of mosquito breeding, inhibits surface and bottom growth, and keeps your water sparkling clean, while adding spectacular aesthetics! To solve all of your aeration needs for both fresh and salt water, call the aeration professionals at Scott Aerator Company today . With nearly 40 years of experience, Scott Aerator is your solution.
